Project Topics And Tools

The Neon Tetra

Chandler Guthrie, Evan Glasscock, Jaeger Nelson, and Steven Bennett

1. NewPipe - Project Overview

1.1. Description

New Pipe is an open source project to give lightweight experiences with existing services. It is an Android application that serves the existing services Youtube, Peertube, Soundcloud, Bandcamp, and media.ccc.de. NewPipe uses its own NewPipeExtractor library which can be used standalone with another application to get the data necessary to populate the NewPipe application. This means there are two existing repos and when modifying the NewPipe repo it may require us to do the same to the Extractor repo.

1.2. Link

- Official Website: <https://newpipe.net/>
- Application Repository: <https://github.com/TeamNewPipe/NewPipe>
- Extractor Repository: <https://github.com/TeamNewPipe/NewPipeExtractor>

1.3. Reason

Previously we had chosen obs-studio as the repo we would maintain. NewPipe has many issues including ones that are more capable during the time given. Working on a project to give an option for everyone to protect their privacy and store their information on their device vs the cloud is our pleasure.

2. NewPipe -cProject Setup

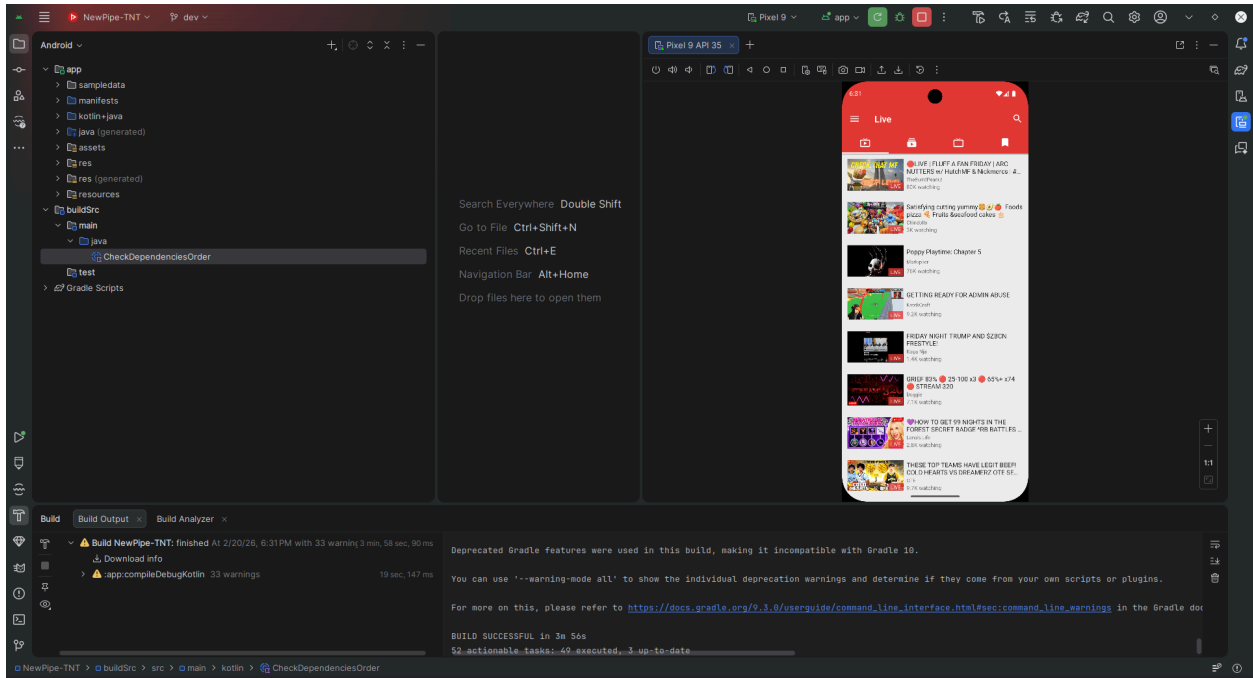

2.1. Status

- NewPipeExtractor has failed and auto-cancelled tests upon cloning due to how services are extracted from third party services.

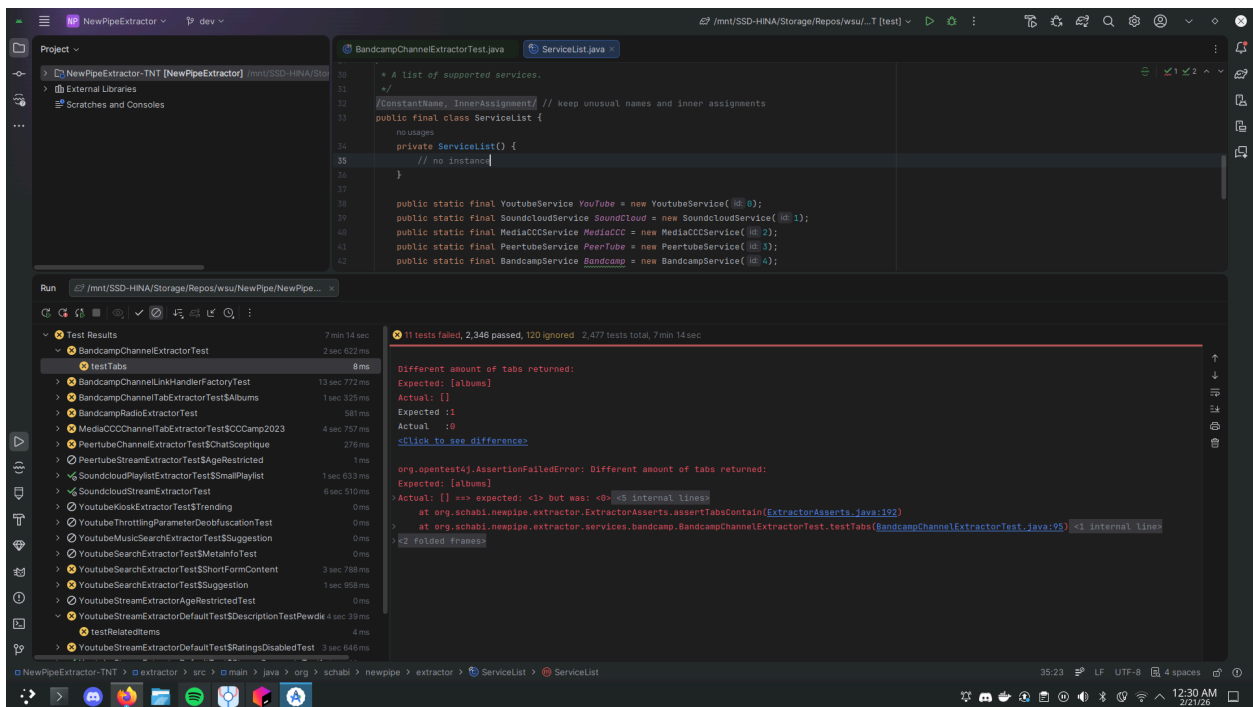

2.2. Success Screenshot(s)

3. Project Tool

3.1. Unit/Integration/System Testing

- JUnit
- Mockito

3.2. Programming Languages (Starting From Mainly Used):

- Java
- Kotlin
- Javascript

3.3. IDE

- Android Studio (By Google)

3.4. Localization

3.4.1. Translations

- Weblate

- 3.4.2. Date/Time
 - PrettyTime

- 3.5. **Style Guides**
 - Check Style
 - ktlint
